Memorandum

To: Mr. R. V. Boyd, Supt. of Operations
From: G. A. Benedict, Supt. of Motive Power & Equipment
Subject: Overloading of Diesels

Reference is made to your memorandum of October 23, 1951, regarding the subject.

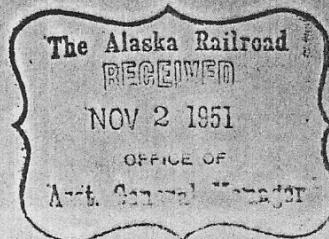

Please note the attached sheet, compiled by Mr. Barnett, Road Foreman of Engines - citing the overloading of 38 diesel locomotives, as noted on the "8 a.m. Situation Report" for the past 60 days.

Also, note memorandum from Mr. Dodd, dated October 25, 1951, Subject - "Traction Motors Overheating" and, finally, photographs of burned out traction motor, field coils, bearings, and armature removed during the past few months, which we feel is caused from continually disregarding the tonnage ratings - as set up by the manufacturer and the Mechanical Department.

We feel that if the tonnage ratings, as compiled, were adhered to, the maintenance costs would be decreased by several thousand dollars a year; also the availability of these locomotives increased considerably.

G. A. Benedict
Supt. of Motive Power
and Equipment

cc: J. E. Manley ✓

Memorandum

To: Mr. G. A. Benedict, Supt., M.P. & E.
From: A. M. Dodd, Diesel Electrician Foreman
Subject: Traction Motors Overheating

Causes of Motor Overheating:

1. Overloading of train.
2. Disregard of operating instructions.
3. Equipment not in good condition.

Overloading:

Of the three causes, over-loading of the train is the most common cause for motors overheating. This may start through emergency operation when an engine is lost, or when other trouble is experienced enroute. The run may be completed successfully without lost time and without any motor trouble reported. It may be possible to pull more tonnage and still make the time without any immediate motor trouble, but in time the motors will show signs of distress.

The motor ammeters are supposed to remedy this. However, if the meter is marked for the various time ratings - continuous, hourly, etc., it must be marked by definite lines. One side of the line then is continuous, and the other side is hourly. In order to protect the motors, the area up to this line must be continuous, the entire adjacent area is hourly and so on. In other words, the locomotive cannot be operated up to capacity under all conditions if the motors are to be protected, and misunderstanding of the use of the meter would defeat the purpose for which it was intended. If the operator has run in the hourly rating for one hour, he cannot then run in the half hour area for one-half hour without overheating the motors. All heating calculations are based on cold motors. It cannot be otherwise if the full utilization of the power is to be realized.

The loss of an engine enroute would, of course, call for a helper locomotive where the tonnage for the remaining power would exceed the rating. It would be necessary in this case to know what the tonnage limit would be for the reduced power, even with the Amp meters. It would be too late to get help if halfway up a grade, the maximum current was exceeded.

Our amp meters reading traction motor current does not help the motor heating situation in the least, the meter can be disregarded as easily as the speedometer. Without proper tonnage ratings the maximum current may be exceeded and if it is, what is the operator to do? He will finish his run and report the trouble and if a reoccurrence is to be prevented, this tonnage will not be carried again. Tonnage rating will automatically be set up, probably higher than they are at present.

Proper tonnage rating is the only protection we know of against misuse of the electric transmission. These tonnage ratings have been questioned from time to time because the extra horsepower, frequently available from the engine, has made it possible to exceed the speed indicated on the tonnage rating charts as a reasonable expectation, and am very much afraid that from time to time when the speed shown was exceeded there has been a tendency to add tonnage so as to stall a locomotive down to the speed given on the chart. This is not only an exceedingly dangerous practice in itself, but leaves the entire question of the loading of the electrical equipment at the mercy of the speedmeter accuracy and operator.

A reasonable amount of excess horsepower output will do no harm to the electrical equipment if it is allowed to express itself in speed, but any attempt to use excess horsepower by hauling excess tonnage will almost invariably lead to the destruction of the traction motors and damage to the rest of the electrical system.

The one certain way to prevent motor overheating is:

1. Adhere to the tonnage rating agreed upon by the Mechanical Department and the builder.

A. M. Dodd
Diesel Electrician Foreman

GEORGIA CAR & LOCOMOTIVE COMPANY

RAILROAD EQUIPMENT

GENERAL OFFICES
RIDGE AVE. AND SOUTHERN RY.

P. O. BOX 1675

ATLANTA 1, GEORGIA

June 4, 1951

Mr. J. P. Johnson, General Manager
The Alaska Railroad
Anchorage, Alaska

Dear Sir:

Herewith photograph and description of two Baldwin 36" gauge 4-6-0 type coal burning steam locomotives, built new 1916, having 16" x 22" cylinders, with tractive effort of 19100 pounds. Driving wheel base 10'. 38" driving wheel centers being 45" when equipped with new tires. Engine proper in working order not including tender, weighs 98800 pounds, the tender having 3000 gallons water capacity and 4 tons of coal. You will find these locomotives in very good condition, having had very little service since last general overhauling, price \$6500 each, fob cars, near Atlanta, Georgia.

If you are needing additional power and their size and tractive effort will meet your requirements, they are great bargains at the above price. We offer them subject to any inspection desired, present location and prior sale. If you would be interested in their purchase, if still available, option could be arranged for your prompt inspection and decision.

Also enclosed is photo and description, one 36" gauge combination mail, baggage and passenger car, in good condition, having all steel under frame and all steel superstructure framing, newly painted and ready for service, mail room being 15' long, baggage room 12' long, passenger compartment 12' long and seating 12 passengers. The outside overall dimensions being as follows:

8' 8" wide, 45' long over couplers.
12' 6" high, top of rail to top of car.

Car is equipped with Westinghouse air brakes, steam heat and electric lights. Price \$5000 fob car near Atlanta, Georgia and subject to any inspection desired before hand, present location.

Both locomotives and car have been well maintained and will give lots and lots of good service in the years to come.

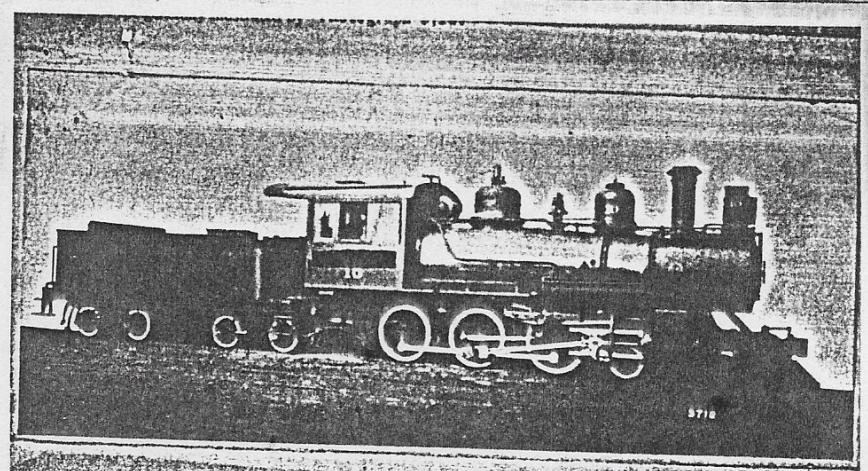

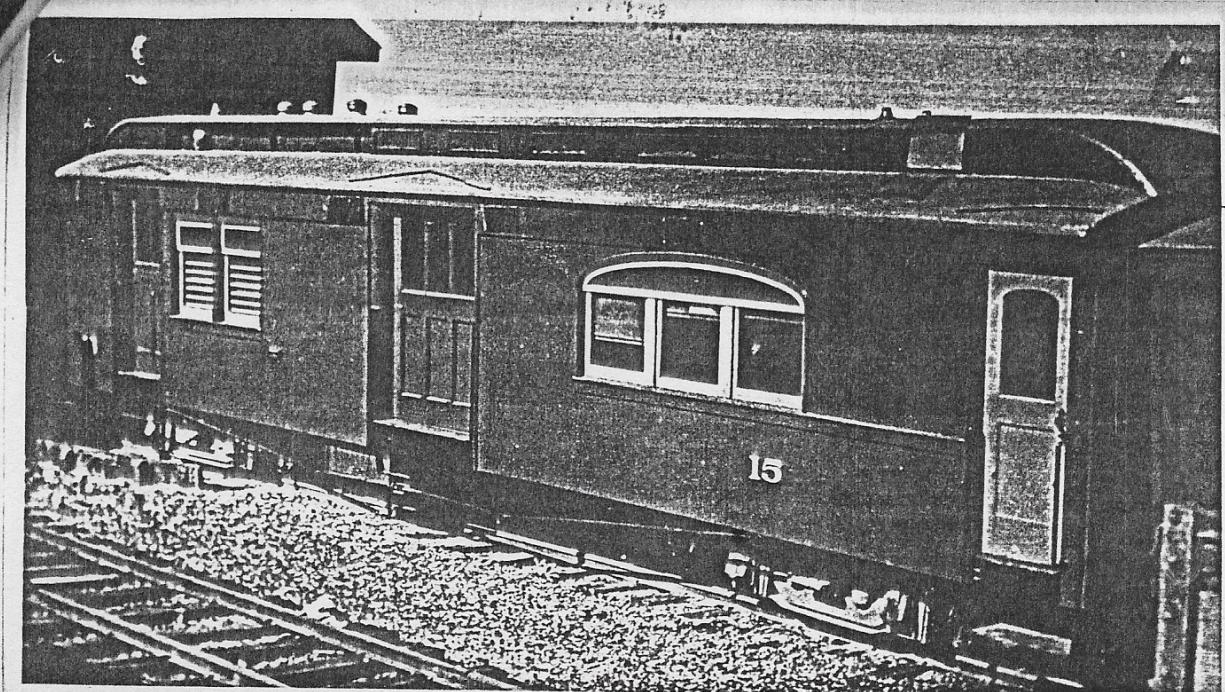

Be good enough to let us hear from you your interest in the purchase of this equipment and we will appreciate the favor.

cc: Mr. G. A. Benedict
Superintendent of Motive Power
Anchorage, Alaska

cc: Mr. J. J. Lichtenwalner
Purchasing Agent

Very truly yours,

Forest Greene, President

Memorandum

To: Colonel J. P. Johnson, General Manager
From: Mr. Irvin P. Cook, Acting Chief Engineer
Subject: Use of 400-Class Engines - Seward to Portage

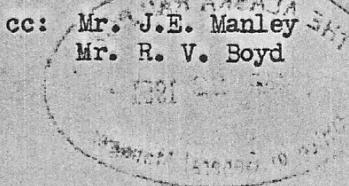

In accordance with your request at the Staff Meeting of March 12, the possibilities of using 400-class engines has been investigated.

The 400-class engines may be used safely until further notice, provided these engines are used single, or with five cars between engines, and the speed limits and other restrictions now in effect strictly enforced. Although the weight of 400-class engines is only eight or nine tons more than the 500-class engines, the loading affect on the bridges is 17.5 percent to 23.8 percent higher (see attached table).

Continued safe use of the heavier power on this portion of the line will depend on our ability to keep up the necessary maintenance and replacement work. A work program calculated to accommodate the anticipated heavy traffic is attached. Most of this work was recommended in the joint Army, Air Force, Great Northern, and Alaska Railroad inspection, reported last June, and is covered by the special one and one-half million dollar appropriation. Completion of the work has been delayed by shortage of materials and labor, and to a great extent by failure of equipment; namely, pile drivers. High priority for repair work of pile drivers will be necessary.

Irvin P. Cook
Acting Chief Engineer

Encls. 2

Anchorage, Alaska
March 20, 1951

MEMORANDUM

TO: Mr. C. L. Griffith, Assistant Chief Engineer
FROM: Mr. Elton J. Lewis, B&B Supervisor
SUBJECT: Necessary Structure Work - Seward to Portage
(*Immediate work to accommodate 400 Class Locomotives)

Bridge 3.0 Needs two new approach spans, bulkheads, ties and guards over steel spans. Remove old filled spans. Paint.

Bridge 3.2 Needs about three helper bents and remove old filled spans.

Bridge 3.3 Needs new ties and guards on steel span. Remove old filled spans and bulkheads. Paint.

Bridge 4.3 Place 36" by 30' C.I.P. Fill from local material and remove old structure, which is very poor condition.

Bridge 4.5 Fill from local material and remove old structure. Does not need culvert.

*Bridge 4.8 Redrive and lengthen from 6 to 7 spans. This structure very poor. Needs channel dozing.

Bridge 6.6 Has a few poor piling but safe until 1952.

*Bridge 14.5 (Snow River) 48 bents. Needs extra stringers and five helper bents immediately. Will have to be rebuilt in 1952.

*Open Culvert

18.6 Replace immediately after frost goes out.

19.9 Filled bridge on curve. Remove.

*Bridge 21.4 Redrive and place sluiceway.

Open Culvert

21.6 Place 48" by 26' C.I.P. and import fill material.
Structure very poor.

Open Culvert

22.6 Place 24" by 24' C.I.P. and import fill material. Structure unsafe.

Bridge 25.5 Needs four helper bents.

Necessary Structure Work
Seward to Portage
Page - 2 *

*Bridge 25.7 Redrive 33 bents.

Bridge 29.5 Under Construction.

Bridge 34.5 Redrive in 1952. Place extra stringers this year.

Bridge 34.7 Drive one helper bent.

Bridge 35.1 Structure poor. Import fill material and remove old structure. No culvert necessary.

Bridge 35.6 Structure poor. Import fill material and remove old structure. Place 48" by 40' C.I.P.

Bridge 36.0 Structure poor. Import fill material and remove old structure. Place 24" by 24' C.I.P.

Bridge 36.4 Structure partly filled and poor. Doze material and remove old structure.

Bridge 36.6 Short span in poor condition. Import fill material. Place 18" by 24' C.I.P.

Bridge 36.7 Short spans (2) in poor condition. Import fill material. Place 36" by 24' C.I.P. Note: From 35.1 to this bridge, channel changes were made in 1947 but needs additional dozing.

Bridge 37.3 Structure poor. Redrive and lengthen from 4 to 5 spans.

Bridge 37.8 Short spans. Import fill material. Place 36" by 24' C.I.P.

Bridge 38.4 Short span. Place new ties, guard rail and repair bulkheads.

*Bridge 41.6 Redrive five spans. Stubbed in 1950 but shows kink in rail.

Bridge 51.8 (See Contract)

Tunnel 51.9 Replace north portal - Six sets.

Bridge 52.0 Immediate maintenance necessary.

Bridge 54.1 Replace ties on steel structure. Redrive approach spans. Remove old filled structure.

Bridge 56.0 Drive two helper bents and replace stringers. Will have to be redriven in 1952.

Bridge 59.0 Minor repair and new stringers. Redrive in 1952.

Necessary Structure Work
Seward to Portage
Page - 3 -

Open Culvert

61.5 Import fill material. Place 48" by 32' C.I.P.

Bridge 64.3 Culvert placed. Import fill material. Remove old structure.

RECOMMENDED PROGRAM:

B & B #1 to finish Bridge 29.5; move to Hunter and work Bridge 41.6 for two weeks; then to Lawing to work 18.6, 21.4, 25.7 and possibly 14.5.

B & B #5 to work from Seward on Bridge 4.8 and repair Bridges 3.0, 3.2, 3.3, 4.3 and 4.5.

Work outlined on bridges marked with an asterisk; namely, 4.8, 14.5, 18.6, 21.4, 41.6 and 25.7, must be completed within the next 60 days and all slow orders and other restrictions now in effect strictly observed in order to permit safe operation of 400-class engines. Use of heavier power on this section of the line is bound to accelerate the deterioration of the old bridge structures. It is entirely possible that additional slow orders and restrictions may become necessary during, or immediately following, the spring thaw.

A close watch is being maintained on the above-mentioned structures. If 400-class locomotives are placed in service, they should be separated by five or more cars.

Memo randum

To: Mr. John E. Manley, Acting General Manager
From: G. A. Benedict, Supt., M.P. & E.
Subject: Proposed loan of A.R.R. Steam Locomotives to the U.S. Army
for emergency Steam Supply in event their Steam Plant was
bombed.

Mr. Kesler, Comptroller Air Command, Phone Air Force - 3288,
has advised that he has been informed that in case the Army Steam Plant is
bombed, The Alaska Railroad would be able to furnish Steam Locomotives
for emergency steam supply. He also stated that their Steam Plant has
4 boilers of 120,000 lb. per hr. capacity each and that three of these
boilers are in use making a total of 360,000 lbs. per hour of steam
available at rated capacity.

He has asked the following questions:

1. How many A.R.R. Steam Locomotives are available for loan.
2. How many pounds of steam these locomotives would furnish
per hour.
3. Could the locomotives be spotted so they could be tied
in to the steam lines.
4. Would it be necessary to install new connections on the
locomotives.
5. What size connections would be needed.

Answers to the above questions are:

1. Steam locomotives available for loan (at the present time):-
2 - 310 Class available.
(Distribution of the 310 class locomotives is):
5 tied up at Birchwood
1 at Whittier
2 at Anchorage
1 at Healy
1 at Fairbanks
10 Total -

No. 400 Class available-distribution of the 400 class
Locomotives is:-

#401 required on the Jonesville Mine run.
#402 required on the North Rotary Fleet.

Mr. J. E. Manley, Acting General Manager -2-

February 26, 1951

#403 Out of Service - Account Fire.

#404 Extra Engine at Anchorage

#405 At Healy.

#406 At Anchorage.

6 - Total

No. 550 Class available-distribution of the 550 Class Locomotives is:

10 required on the Seward-Anchorage Division in Freight and Passenger Service.

1 Out of Service - Account Wreck and Fire.

11-Total

No. 700 Class available - distribution of the 700 class Locomotives is:

#701 on North Snow Fleet

#702 Extra Engine Anchorage

#703 Laid up at Fairbanks - Out of Service

3 -Total

No. 800 Class available - distribution of the 800 Class Locomotives is:

#801 - Out of Service - Account Wreck.

#802 - " " " - " "

2 - Total

No. 900 Class available - distribution of the 900 class Locomotives is:

#901 - Out of Service - Account Wreck.

#902 - Out of Service - Account Fire, but being rebuilt.

2 - Total

As shown above there are only 2 - 310 Class Locomotives available at present for loan.

2. Pounds of Steam these locomotives would furnish. This is estimated at 8300 lbs. per hour per locomotive or a total of 16,600 lbs. per hour for two - 310 Class Locomotives
3. Spotting of locomotives to tie into Steam lines. - We are not familiar with relative positions of the Steam Plant and trackage but it is presumed that the locomotives could be tied in by use of sufficient pipe, fittings, insulation, etc.

Mr. J. E. Manley, Acting Gen. Manager

-3-

February 26, 1951

4. Installation of new fittings on the locomotives. - This would not be necessary as connection could be made to existing Steam Train lines.

5. Size connections needed. - The Steam Train line is 2" diameter.

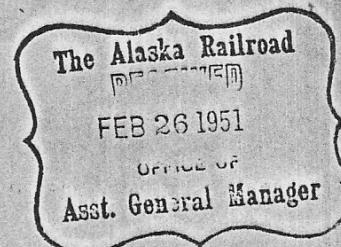

For your information, the steam generating capacity of the various class locomotives has been estimated as follows:

310 Class	-	8300	lbs.	per hr.	per Locomotive
400 "	-	8300	"	"	"
550 "	-	7700	"	"	"
700 "	-	11500	"	"	"
800 "	-	12300	"	"	"
900 "	-	11400	"	"	"

Mr. Kesler requested that he be advised in regard to the above as soon as possible. If you want this information given to the Army, please advise and a letter will be prepared for your approval and signature.
